

Project Structure & Directory Overview

Comprehensive breakdown of files and architecture for the Next.js / Prisma full-stack application

- Next.js
- TypeScript
- Prisma ORM
- Tailwind CSS
- Docker

Architecture Overview: This project is a production-ready, full-stack web application built on **Next.js** with **TypeScript**. Data persistence and migrations are managed through **Prisma ORM** targeting a relational database, while deployment and runtime containerization are structured for **Vercel** and **Docker**.

1. Environment & Configuration Files

File / Directory	Category	Description
<code>.env</code> <code>.env.local</code> <code>.env.production.local</code>	ENVIRONMENT	Store environment-specific sensitive variables (database URLs, API tokens, session secrets). Separated by deployment stage.
<code>.env.example</code>	ENVIRONMENT	Template specifying required environment variables without real credentials for developer onboarding.
<code>.gitignore</code>	GIT	Excludes files like <code>node_modules/</code> , build artifacts, and local secrets from Git version control.
<code>.vercelignore</code>	DEPLOYMENT	Instructs Vercel deployment builds on which local files or assets to omit during build packaging.
<code>docker-compose.yml</code>	DOCKER	Defines multi-container Docker services (e.g., local PostgreSQL/MySQL databases) for development.
<code>next.config.ts</code>	NEXT.JS	Main Next.js framework setup including routing rules, image domain whitelists, and compiler flags.
<code>package.json</code> <code>package-lock.json</code>	NODE.JS	Tracks project dependencies, build/dev scripts, and exact locked versions across environments.
<code>postcss.config.mjs</code>	STYLING	Configures PostCSS transformations, primarily for processing Tailwind CSS utilities and Autoprefixer.
<code>tsconfig.json</code> <code>tsconfig.tsbuildinfo</code>	TYPESCRIPT	Compiler options and path aliases (<code>@/*</code>), along with build caching for faster incremental compilation.
<code>next-env.d.ts</code>	TYPESCRIPT	Auto-generated TypeScript declaration file enabling Next.js global type integration.
<code>CONTRIBUTING.md</code>	DOCS	Developer guidelines for workflow, code style, branching strategies, and pull requests.
<code>media-url-snapshot.json</code>	DATA	JSON snapshot file for tracking media assets, CDN URLs, or static link mappings.

2. Database Layer (Prisma ORM)

Path	Category	Description
prisma/schema.prisma	SCHEMA	Primary database schema defining data models, fields, relations, and database engine provider settings.
prisma/migrations/	MIGRATIONS	Chronological database migration SQL files applying incremental schema evolution: • 20260718184903_init: Base tables setup • 20260725153739_add_site_settings: Global configuration settings • 20260725225321_add_hero_showcase_i...: Showcase image schemas
prisma/migration_lock.toml	LOCKFILE	Locks the active database provider to ensure consistency across deployment environments.
prisma/seed/	SEEDING	Database seeding scripts to populate development environments with baseline initial data.

3. Key Directories & Application Modules

Directory	Category	Description
src/	SOURCE	Primary application codebase containing Next.js routes, API handlers, components, and helper utilities.
public/	ASSETS	Static web assets served directly by Next.js: • brand/: Official logos, brand graphics, and icons • uploads/: User/Admin uploaded media files
JRA / JRA-moreassets	MODULES	Custom project folders housing specific domain modules, brand assets, or design resources.
messages/	I18N	Localization and internationalization dictionary files (e.g., standard `next-intl` translation keys).
docs/	DOCS	Project documentation detailing system design, API contracts, and architecture workflows.
scripts/	SCRIPTS	Utility scripts for automated administrative tasks, maintenance, or data transformations.
.claude/	TOOLING	Workspace configuration and custom settings for the Claude Code CLI execution environment.
.next/ / .vercel/ / .vscode/	SYSTEM	Auto-generated framework build output, Vercel deployment links, and IDE editor settings.
